

# Remote flour control at your customer (bakery)

Remote control -  
Remote monitoring -  
Remote alarm of your  
customer's flour or product level

**easy - reliable - cheap**

Remote content and level  
monitoring of bulk products

Easy and cheap solution  
especially for small and  
medium-sized companies

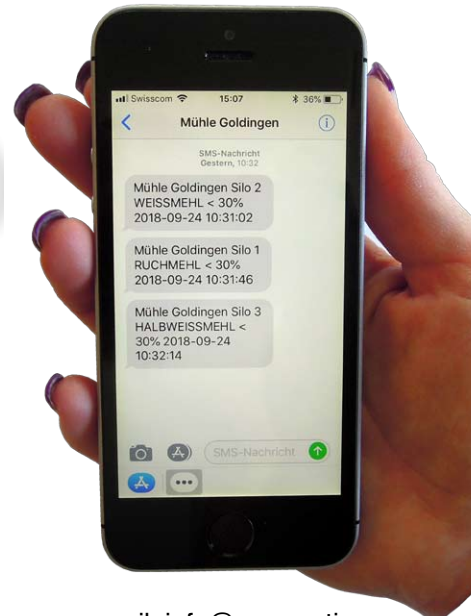

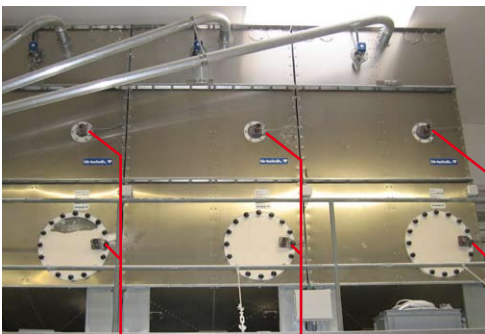

Select either individual  
scan or automatic data  
transmission

## Construction:

The level indication is either made with continuous level measurement by means of radar or with ultra sonic sensors, depending on the silo construction. In most cases the usage of one to two level sensors per flour bin is sufficient. The datahandling is made in the SMS-GSM transmission mode and can directly be forwarded to your mobile phone or PC. You can use SIM-cards of your favourite mobile phone carrier.

## Functioning:

The level within a group of 1 - 6 silos is continuously scanned and transmitted either in certain time intervals or as soon as a set minimum level has been reached. The transmission is made in ASCII signs and can be transferred to 1 - 4 receivers simultaneously. The message contains: customer, silobin, flour type, level, date and time. During transmission only the costs for SMS are due, which may vary depending on your carrier. The units are configured and being supplied including the required configuration; mounting material is also included. Assembly is easy and can be made at site.
